China Metallurgical Group, a company principally engaged in engineering, procurement and construction, real estate development and equipment fabrication, has received a contract from Global Partners United to build facilities related to Bixby Energy Systems's coal-to-gas technology throughout China.

China Metallurgical Group (MCC) will act as general contractor and work collaboratively with Global Partners United (GPU), Bixby Energy's strategic partner and licensee in China. Bixby Energy will support MCC by providing a team of engineers to assist in the correct installation of its systems. Bixby Energy is the innovator of the Bixby Process, a method of converting coal into clean-burning energy.

Robert Walker, chairman, CEO and president of Bixby Energy Systems, said: "Our team in China is now firmly in place and Bixby Energy is well positioned to do business there. The market in China is significant with millions of tons of coal in its reserves that can be converted to high-quality synthetic natural gas representing significant revenues for Bixby Energy."
